

UNITED STATES DEPARTMENT OF THE INTERIOR
GEOLOGICAL SURVEY

SUMMARIES OF DATA ON AND LISTS OF REFERENCES TO
METALLIC AND SELECTED NONMETALLIC MINERAL OCCURRENCES
IN THE AMBLER RIVER QUADRANGLE, ALASKA,
SUPPLEMENT TO OPEN-FILE REPORT 75-628

PART A -- SUMMARIES OF DATA TO JANUARY 1, 1981

By
Edward H. Cobb and Charles F. Mayfield

Open-File Report 81-570 A
1981

This report is preliminary and has
not been reviewed for conformity
with U.S. Geological Survey
editorial standards.

Introduction

This report was prepared as a supplement to a 1975 report which summarized data on mineral occurrences in the Ambler River and other quadrangles in northern Alaska (Cobb, E. H., 1975, Summary of references to mineral occurrences (other than mineral fuels and construction materials) in northern Alaska: U.S. Geological Survey Open-File Report 75-628, 106 p.). As a result of suggestions from users of the series of which the 1975 report is a part, this supplement is released in two parts: Part A, which presents summaries of data to January 1, 1981, and Part B, which consists of reference lists for each occurrence.

In Part A data from most reports released between the cut-off date (January 1, 1975) for the original report and January 1, 1981, have been incorporated in rewritten or new summaries where appropriate. For each occurrence described in Part A the name, U.S. Bureau of Mines mining district, reference that has the occurrence plotted on a map, list of mineral commodities, and location data are in the same format as in the 1975 report. Also included is an updated list of synonyms, owner, operator, and claim names.

In both parts citations are in standard bibliographic format with the exception that references to reports and maps in numbered publication series also show, in parentheses, an abbreviation for the report or map series and the number of the report or map. Abbreviations used are:

AOF	Alaska Division of Geological and Geophysical Surveys Open-File Report
B	U.S. Geological Survey Bulletin
C	U.S. Geological Survey Circular
GR	Alaska Division of Geological and Geophysical Surveys (and predecessor State agencies) Geologic Report
IC	U.S. Bureau of Mines Information Circular
OF	U.S. Geological Survey Open-File Report
MF	U.S. Geological Survey Miscellaneous Field Studies Map
P	U.S. Geological Survey Professional Paper
RI	U.S. Bureau of Mines Report of Investigations
TDM	Alaska Territorial Department of Mines Pamphlet
USBM OF	U.S. Bureau of Mines Open-File Report

In Part B citations to the principal references used in preparing summaries in Part A are preceded by an asterisk. The form of citation used in the reference list for each occurrence is considered sufficient identification for each numbered report or map to be found easily in most libraries. Complete references to reports without identifying numbers are listed at the end of Part B.

The following five U.S. Bureau of Mines Open-File Reports were not used in preparing this supplement, because descriptions of most occurrences are not sufficiently detailed to allow evaluation of deposits. In many descriptions it is not possible to determine if a potentially valuable

mineral was identified or if the report is based solely on an analysis of a sample collected during a geochemical survey. Most specific data are also in other reports, such as Degenhart and others, 1978 (USBM OF 103-78) and Grybeck, 1977 (OF 77-166C).

Staff, Alaska Field Operations Center, 1978, Mineral data appraisal of the proposed Noatak National Ecological Reserve, Alaska: A preliminary comment: U.S. Bureau of Mines Open-File Report 67-78, 33 p.

____ 1978, Mineral appraisal of the proposed Gates of the Arctic Wilderness National Park, Alaska: A preliminary comment: U.S. Bureau of Mines Open-File Report 109-78, 29 p.

____ 1978, Mineral appraisal of the proposed Kobuk Valley National Park, Alaska: A preliminary comment: U.S. Bureau of Mines Open-File Report 110-78, 31 p.

____ 1979, A mineral appraisal of the areas traversed by the Kobuk, Killik, Alatna and John Rivers and the North Fork of the Koyukuk River, Brooks Range, Alaska: A summary report: U.S. Bureau of Mines Open-File Report 36-79, 23 p.

____ 1979, A mineral appraisal of the areas traversed by the Salmon and Noatak Rivers in the western Brooks Range; A summary report: U.S. Bureau of Mines Open-File Report 50-79, 16 p.

(Agnes Cr.)

Gold

Kiana district
OF 78-120I, loc. 16

Ambler River (10.3, 3.9) approx.
65°13'N, 157°29'W approx.

A little placer gold was recovered. Most of the work was prospecting in 1930's rather than mining. See also (Ambler Valley).

(Ambler R., headwaters)

Copper

Kiana district
OF 78-120I, locs. 59-61

Ambler River (16.3-16.7, 10.1-10.9)
67°33'-67°36'N, 156°30'-156°34'W

Malachite in quartz veins or conglomerate. At loc. 60 (67°35'N, 156°32'W) quartz veins (traceable for at least 50 m) in marble near contact with phyllite also contain azurite and chalcopyrite.

(Ambler Valley)

Gold

Kiana district

Ambler River
E 1/2 quad.

Coarse gold reported to have been mined. See also (Agnes Cr.), to which the principal reference to this occurrence probably refers.

Arctic (Camp)

Copper, Gold, Lead, Silver, Zinc

Shungnak district
OF 78-120I, loc. 42

Ambler River (18.0, 3.55)
67°11'N, 156°21'W

Polymetallic stratabound volcanogenic deposit within a suite of low- to medium-grade igneous and pelitic schists. Pyrite, chalcopyrite, and sphalerite comprise 20%-90% of sulfide horizons 0.3 to more than 18 m thick in a triangular-shaped mineralized zone about 1,030 x 730 m in plan and about 90 m thick. Principal sulfides are accompanied by small amounts of pyrrhotite, chalcocite, bornite, and galena, and traces of tennantite. Small gossan cap. Sulfides occur as high-grade disseminations and as massive layers parallel to foliation and original bedding. Host rock of volcanic origin has U-Pb age of 360 ± 10 m.y.; interlayered marble contains poorly preserved Devonian(?) fossils. The deposit was metamorphosed about 90 m.y. ago. Deposit was drilled and estimated to contain 27-32 million tonnes (30-35 million tons) of material averaging 4% Cu, 5.5% Zn, 1% Pb, 5.14 g tonne (1.5 oz/ton) Ag, and a small amount of Au.

(Asbestos Mtn.)

Asbestos, Jade, Quartz, Talc

Shungnak district
OF 78-120I, loc. 29

Ambler River (14.9, 1.45)
67°01'N, 156°50'W

Serpentinized ultramafic body contains veins and veinlets of cross- and slip-fiber tremolite and chrysotile asbestos, small deposits of talc and soapstone, and nephrite. During World War II about 33.1 tonnes (36.5 tons) of tremolite was mined from a trench and shipped to use in filters. About 0.9 tonne (1 ton) of chrysotile was shipped at the same time. A little over 1/2 ton of USBM samples tested was found not suitable for spinning. Optical quartz crystals collected from float from veins near the head of Dahl Cr. were shipped in 1943. 76-m adit designed to intersect asbestos veins exposed at surface did not disclose minable material. Includes ref-

erences to bedrock occurrences at head of Dahl Cr. and to Ing-Ihk. See also (Dahl Cr.) Shungnak quad.

(Aurora Mtn.)

Copper, Gold, Lead, Silver

Shungnak district
OF 78-120I, locs. 21, 22

Ambler River (13.0-13.5, 1.2-1.35)
67°03'-67°04'N, 157°02'-157°06'W

Host rocks at loc. 21 (67°04'N, 157°06'W) consist of quartz-mica schist underlain by carbonate. Schist has thinly interlayered pyrite and chalcopyrite. Brownish-weathering dolomitic zones in carbonate have disseminated blebs of chalcopyrite and bornite with malachite on weathered surfaces [Mayfield, personal observation, 1978]. At loc. 22 (67°03'N, 157°02'W) [commonly called Pardners Hill] structure is generally synclinal with dolomitic limestone (some reefoid) above (probably a fault contact) phyllitic schist. Near contact chalcopyrite, bornite, galena, and secondary copper minerals are in dolomitic reef breccia. Selected samples of sulfide minerals contained as much as 1.37 g/tonne (0.04 oz/ton) Au and 47.9 g/tonne (1.4 oz/ton) Ag. Explored by a 22-ft shaft, an adit, trenching, and drilling. Data on grade and tonnage not available. Has been no mining. Includes references to (Pardner(s) Hill) and to lodes at head of Cosmos Cr.

(Bismark Cr.)

Gold

Shungnak district
MF-454, loc. 9

Ambler River (12.15, 0.85) approx.
67°02'N, 157°13'W approx.

Creek gravels near mouth, as much as 20 ft thick, contain flour gold. Two small prospect pits yielded 0.075 and 0.045 oz/yd³ Au.

(Bismark Mtn.)

Asbestos, Jade

Shungnak district
OF 78-120I, loc. 18

Ambler River (11.85-11.9, 0.95-1.1)
67°03'N, 157°15'-157°16'W

Highly serpentized zones in a large mass of ultramafic rocks in schist contain slip-fiber and short cross-fiber chrysotile in veins and veinlets 1/2- 2 in wide. Two tons of bulk samples shipped during World War II for testing; asbestos not suitable for high-class industrial uses. Magnesite veinlets also present. Nephrite near some serpentinite contacts. See also (Shungnak R.).

(Boulder Cr.)

Gold

Shungnak district

Ambler River (15, 0)(?)
67°01'N, 156°45'W approx.(?)

Small-scale placer gold mining was reported from 1933 to 1939. Location uncertain; tributary of Kogoluktuk R.

(Canyon Cr.)

Gold

Shungnak district
OF 79-120I, loc. 31

Ambler River (16.15, 0.4)
67°00'N, 156°38'W

Fine gold found in prospect shaft sunk 40 ft in unfrozen ground without reaching bedrock; in 1931 or earlier.

(Cosmos Cr.)

Asbestos, Gold, Jade

Shungnak district
OF 78-120I, loc. 20

Ambler River (12.75 - 12.95, 0.5-0.75)
67°01'-67°02'N, 157°06'-157°08'W

Low-grade chrysotile in thin veinlets in sheared serpentinite near creek. Colors of gold throughout 40 ft of gravel penetrated by prospect shafts; no minable concentrations found. Nephrite boulders in creek gravels have been collected and sold. See (Aurora Mtn.) for data on metallic lodes at head of creek.

(Dead Cr.)

Copper, Lead, Zinc

Shungnak district
OF 78-120I, loc. 41

Ambler River (16.8, 3.7)
67°11'N, 156°32'W

Pyrite, chalcopyrite, bornite, sphalerite, and minor galena present as disseminated grains and semimassive lenses in coarse-grained quartz-muscovite schist. Mineralized schist is between layers of greenstone, some of which actually may be tuffaceous or argillaceous dolomite. Several diamond-drill holes put down, but results not released. No data on probable silver and gold content.

(Diane Cr.)

Copper, Zinc

Shungnak district
OF 78-120I, loc. 43

Ambler River (18.9, 3.1)
67°09'N, 156°13'W

Disseminated chalcopyrite, bornite, sphalerite, and pyrrhotite in calcareous schist and calc-silicate rocks; mainly as float.

(Horse Cr.)

Copper, Lead, Zinc

Kiana district
OF 78-120I, loc. 39

Ambler River (15.3, 5.35)
67°17'N, 156°45'W

Country rock is interbedded porphyroblastic quartz-muscovite-calcite schist, graphitic schist, greenstone (some with definite pillow structures), and weakly metamorphosed semischistose graywacke. Interbedded graywacke and porphyroblastic schist contain pyrite, chalcopyrite, bornite, galena, and sphalerite in lenses, stringers, disseminations, and (in places) massive pods. No data on probable precious-metal content.

(Hunt R.)

Asbestos, Gold(?)

Kiana district
OF 78-120I, loc. 9 (in part)

Ambler River (3.0, 5.8) (in part)
67°20'N, 158°33'W (in part)

Mountain leather and tremolite asbestos with fibers 2 in long from veinlet not more than 1/2 in wide in serpentine at loc. 9 (67°20'N, 158°33'W). Unverified report of vein quartz carrying more than \$100/ton in gold (at \$20.67) from Hunt R. near Jade Mts.

(Imelyak R.)

Barite, Copper, Lead, Zinc

Noatak district
OF 78-120I, locs. 75, 76

Ambler River (11.85, 11.0-11.35)
67°37'-67°38'N, 157°13'W

At loc. 75 (67°38'N, 157°13'W) sphalerite and galena in shear zone less than 1 m wide and barite, malachite, and azurite in vein less than 2 m wide; both in limestone. At loc. 76 (67°37'N, 157°13'W) malachite, azurite, and chalcopryrite in small pods and fracture surfaces in quartz conglomerate below a thrust fault.

(Iron Mtn.)

Iron

Shungnak district
MF-454, loc. 5

Ambler River (13.85, 1.0)
67°03'N, 156°59'W

Float specimens of magnetite weighing as much as 100 lb or more are common, but none of this material has been found in place. Magnetite seems to be most common near bedrock contacts between limestone and schist.

(Jade Mtn.)

Asbestos, Jade, Nickel

Kiana district
OF 78-120I, locs. 14, 15

Ambler River (6.45-8.2, 3.1-3.8)
67°10'-67°13'N, 157°48'-158°03'W

At loc. 14 (67°12'-67°13'N, 158°03'W) a highly serpentized ultramafic rock underlying an area of at least 2 mi² contains nephrite jade and small amounts of cross-fiber chrysotile and tremolite asbestos; some slip-fiber chrysotile also, with fibers as much as 5 in long. Large nephrite boulders, some weighing several tons, form an extensive residual deposit on hillside. There has been minor production of nephrite from stream gravels. Some nephrite of gem quality has been mined. At loc. 15 (67°10'N, 157°48'W) ultramafic rocks contain garnierite or a closely related nickel mineral. Includes references to: (Jade Cr.), (Jade Hills). See also (Jade Mts.)

(Jade Mts.)

Copper, Lead

Kiana district
OF 78-120I, loc. 13

Ambler River (5.7, 4.4)
67°15'N, 158°10'W

A vein in limestone contains malachite, azurite, and galena.

(Jay Cr.)

Gold

Shungnak district
OF 78-120I, loc. 23

Ambler River (13.95, 1.55)
67°05'N, 156°57'W

Bedrock is phyllite. A little placer gold was recovered in 1931.

(Kaluich area)

Copper, Fluorite, Lead

Noatak district
OF 78-120I, loc. 6 (in part)

Ambler River (5.35-5.6, 9.85-9.95)
67°34'N, 158°10'-158°12'W

Contact-metamorphic deposit. Minor amounts of galena, fluorite, and malachite in granite in zone near contact with black, soft siltstone and carbonate rocks over a distance of about 1.6 km. Area of 13 km² geochemically anomalous in Pb and Zn.

(Kaluich Cr.)

Copper

Noatak district
OF 78-120I, loc. 2

Ambler River (4.25, 11.3)
67°39'N, 158°22'W

Small malachite-stained quartz vein in iron-rich black phyllite, which is geochemically anomalously high in Ag, Ba, Mo, and V in a zone extending along strike for at least 2.5 km.

(Kav)	Antimony, Copper, Silver
Noatak district	Ambler River (14.8, 14.4)
OF 78-120I, loc. 71	67°48'N, 156°46'W

Dolomite breccia with quartz veins contains tetrahedrite, tennantite(?), chalcopryite, azurite, and malachite. Breccia is overlain and underlain by limestone (some marble). Occurrence consists of 3 bedrock exposures and talus in an area of 0.15 mi². Samples contained 0.36%-33.8% Cu, as much as 3.2% Sb, small amounts of Pb and Zn, and 0.4-4.9 oz/ton Ag. Insufficient data to determine source of mineralization or to evaluate resource.

(Kobuk R.)	Jade(?)
Kiana district	Ambler River (0.3, 2.5)
OF 78-120I, loc. 12	67°09'N, 158°56'W

Claims staked, 1978-70. "Jade cutting" reported.

Malfiatti	Copper
Kiana district	Ambler River (0.0, 9.25)
MF-454, loc. 1	67°32'N, 159°00'W

Prospect on copper lode; reported to be between limestone and schist. Discovered about 1912.

(Midas Cr.)	Gold
Noatak district	Ambler River (18.3, 15.2)
MF-454, loc. 12	67°51'N, 156°14'W

Small particles of gold, found in 1904, may have been derived from metamorphic rocks south of the Noatak R. or concentrated from glacial outwash. Piece of quartz float assayed 7.2 ppm Ag and 145 ppb Au.

(Nanielik Cr.)	Barite
Noatak district	Ambler River (0.9, 16.25)
OF 78-120I, loc. 1	67°56'N, 158°52'W

One-meter-thick barite vein in limestone. Nearby soil contains 1,000 ppm Pb and 5,000 ppm Zn.

(Natmotirak Cr.)	Copper, Silver
Noatak district	Ambler River (0.75, 12.1)
OF 78-120I, loc. 3	67°41'N, 158°53'W

Vein less than 1 m wide in limestone contains visible chalcopryite and malachite. Rock sample contained 10 ppm Ag.

(Ningyoyak Cr.)	Copper
Noatak district	Ambler River (17.7, 15.7)
OF 78-120I, loc. 64	67°52'N, 156°19'W

Malachite and chalcopyrite in quartz-carbonate stringers in phyllite exposed in an area about 75 x 100 ft and to a depth of about 10 ft. Has been a little trenching.

(Pearl Cr.)

Gold

Shungnak district
OF 78-120I, loc. 32 approx.

Ambler River (14.85, 1.8) approx.
67°05'N, 156°50'W approx.

Small-scale mining in 1933 reported; tributary of Shungnak R.; location uncertain.

(Que Cr.)

Copper

Shungnak district
OF 78-120I, loc. 44

Ambler River (19.45, 2.8)
67°08'N, 156°09'W

Stratabound volcanogenic deposit. Disseminated malachite in muscovite-quartz schist for at least 275 m along strike.

(Riley Cr.)

Gold

Shungnak district
OF 78-120I, loc. 28

Ambler River (14.4-14.55, 0.95-1.05)
67°03'N, 156°53'-156°54'W

Eluvial placer near head of creek was 200 m long, less than 10 m wide, and about 2 m thick; contained large exotic greenstone boulders. Gold fine, angular, and spongy with considerable attached quartz. Much of gold in bedrock crevices. Bedrock is black slate, phyllite, and limestone; many quartz veins, some of which contain visible free gold. Mining before 1910, in 1917, and annually from 1933 to 1940. Total production probably small.

(Ruby Cr.)

Antimony, Barite, Cobalt, Copper, Fluorite,
Germanium, Gold, Lead, Silver, Uranium(?),
Zinc

Shungnak district
MF-454, loc. 6

Ambler River (14.0-14.2, 1.4-1.7)
67°04'-67°05'N, 156°56'-156°57'W

Deposit structurally and stratigraphically controlled in a 760-m-thick Devonian sequence consisting of dolomite, limestone, and calcareous phyllite. Sulfide minerals fill open spaces and occur as replacement bodies in brecciated reefoid carbonate rocks. Mineralized bodies generally have longest dimension parallel to bedding. Wall rocks typically do not show alteration. Sulfide minerals are mainly pyrite, chalcopyrite, and bornite; others include tennantite-tetrahedrite, sphalerite, chalcocite, galena, pyrrhotite, marcasite, carrollite (a cobalt-copper sulfide), germanite (a germanium-bearing copper-iron sulfide), and covellite. Other minerals identified include cymrite (a hydrous silicate containing barium), malachite, azurite, native copper, native silver, cuprite, barite, and fluorite. An unidentified radioactive mineral is present; selected samples contained as much as 0.02% eU, but the uranium content of the ore apparently is negligible. Origin of deposit is speculative. Sulfur-isotope studies (by Runnells) suggest a magmatic hydrothermal origin and that copper may have come from nearby mafic intrusive rocks. Fritts concluded that the deposit is allochthonous and related to the solutions responsible for serpentization of mafic rocks in the general area.

Another possible source is magmatic hydrothermal solutions from granitic plutonic rocks underlying the Cosmos Hills dome. Mineralization also may be related in time and origin to volcanogenic deposits to the north such as Arctic deposit. The deposit has been known since the early 1900's, but most exploration (many tens of thousands of feet of drilling, a shaft more than 1,000 ft deep, and drifts on 2 levels) has been since 1957. Current grade and tonnage figures are not available. A resource estimate published in 1975 was 5 million tons of material with 4%-5% Cu. A little placer gold is reported to have been recovered from Ruby Cr. many years ago. Includes references to (Bornite).

(Shishakshinovik Pass)

Antimony, Copper, Gold, Lead, Molybdenum,
Silver, Zinc

Noatak and Shungnak districts
OF 78-120I, locs. 50-52

Ambler River (18.0-18.4, 7.7-8.4)
67°25'-67°27'N, 156°17'-156°20'W

A prospector reported at loc. 50 (67°27'N, 156°19'W) "a considerable deposit of copper ore..." and native copper in streams. Float from the north side of the divide contained tetrahedrite. Assays of selected samples showed 9.81% Cu, 27.73% Pb, and some Au and Ag. At loc. 51 (67°25'N, 156°20'W) quartzitic rocks in contact aureole around a granite pluton contain numerous small quartz veins and veinlets with chalcopyrite. At loc. 52 (67°25'N, 156°17'W) granite near the contact zone contains minor amounts of galena, sphalerite, and molybdenite; high geochemical anomalies in area; sample of a float boulder contained 2% Pb, 1.6% Zn, and more than 102.8 g/tonne (3 oz/ton) Ag.

(Shungnak R.)

Asbestos, Copper, Gold, Jade, Silver

Shungnak district

Shungnak district	Ambler River (13.6, 0.3) approx.
OF 78-120I, loc. 26 approx.	67°00'N, 157°01'W approx.

Quartz veins in dolomite west of creek contain a little galena; explored by a shallow prospect hole. Tremolite asbestos and gem-quality nephrite jade near head of creek.

Unnamed occurrence	Antimony, Lead
Kiana district	Ambler River (5.9, 8.1)
OF 78-120I, loc. 7	67°28'N, 158°08'W

Boulangerite ($\text{Pb}_5\text{Sb}_4\text{S}_{11}$) in reddish-weathering dolomite.

Unnamed occurrence	Asbestos, Copper
Kiana district	Ambler River (1.0, 5.25)
OF 78-120I, loc. 11	67°18'N, 158°51'W

Asbestos veinlets and copper staining on fractures in serpentinite.

Unnamed occurrence	Asbestos, Copper
Kiana district	Ambler River (1.35, 5.5)
OF 78-120I, loc. 10	67°19'N, 158°48'W

Asbestos in serpentinite. Chalcopyrite and malachite in mafic rocks.

Unnamed occurrence

Copper

Kiana district

Ambler River (16.2, 7.5)

OF 78-120I, loc. 48

67°25'N, 156°36'W

Bornite, chalcopryite, cuprite, and pyrite in a 6-m-thick quartz vein in limestone near contact with granite.

Unnamed occurrence

Copper

Noatak district

Ambler River (18.85, 10.75)

OF 78-120I, loc. 55

67°35'N, 156°11'W

Sparse massive sulfide samples containing chalcopryite and malachite weathering from dolomite near contact with quartzite.

Unnamed occurrence

Copper

Noatak district

Ambler River (12.9, 15.35)

OF 78-120I, loc. 67

67°52'N, 157°03'W

Chalcopryite, malachite, and azurite along fracture surfaces in quartzite.

Unnamed occurrences

Copper

Ambler River

The following occurrences consist of malachite, in some instances accompanied by azurite, in a variety of geologic settings. At no locality was any copper or other sulfide mineral except pyrite identified, though geochemical anomalies for various elements were reported at or near some of the occurrences.

Kiana district

(13.35, 5.0)	67°17'N, 157°02'W	OF 78-120I, loc. 38
(12.25, 5.65)	67°19'N, 157°11'W	do loc. 35
(17.1, 9.65)	67°32'N, 156°27'W	do loc. 57
(1.4, 10.8)	67°37'N, 138°47'W	do loc. 4

Boundary between Kiana and Noatak districts

(17.6, 11.1)	67°37'N, 156°22'W	OF 78-120I, loc. 56
--------------	-------------------	---------------------

Noatak district

(13.15, 14.7)	67°50'N, 156°01'W	OF 78-120I, loc. 68
(17.9, 12.25)	67°41'N, 156°19'W	do loc. 62
(14.5, 12.75)	67°46'N, 156°49'W	do loc. 72
(13.35, 13.8)	67°46'N, 156°59'W	do loc. 73
(12.45, 13.9)	67°47'N, 157°07'W	do loc. 74
(13.0, 15.55)	67°53'N, 157°02'W	do loc. 66

Unnamed prospect

Copper, Lead

Kiana district

Ambler River (15.8, 7.4)

OF 78-120I, loc. 49

67°24'N, 156°39'W

Numerous small quartz veins and veinlets with chalcopryite and galena in quartzose rocks in contact aureole of granite. Lode claims staked in 1974.

Unnamed prospect	Copper, Lead
Kiana district	Ambler River (16.85-17.15, 7.3-8.0)
OF 78-120I, loc. 47	67°24'-67°26'N, 156°27'-156°30'W
Numerous small quartz veins and veinlets with chalcopyrite and galena in quartzose rocks in contact aureole of granite. Claims staked in 1974.	
<hr/>	
Unnamed occurrence	Copper, Lead, Vanadium, Zinc
Noatak district	Ambler River (14.45, 15.0)
OF 78-120I, loc. 70	67°50'N, 156°49'W
Sphalerite, galena, and malachite in small outcrop of quartzite. Hearby black pyritic phyllite contains 1,000 ppm V and 70 ppm Mo.	
<hr/>	
Unnamed occurrence	Lead
Kiana district	Ambler River (17.25, 7.1)
OF 78-120I, loc. 46	67°23'N, 156°27'W
Galena, magnetite, and pyrite in float of quartz vein.	
<hr/>	
Unnamed occurrence	Uranium
Kiana district	Ambler River (17.55, 7.65)
OF 78-120I, loc. 80	67°25'N, 156°23'W
Metatorbernite (copper uranyl phosphate hydrate) in quartzite talus from south side of cirque basin.	
<hr/>
