Vitrinite reflectance data for the Permian Basin, west Texas

and southeast New Mexico

This report presents a compilation of vitrinite reflectance (R_o) data based on analyses of samples of drill cuttings collected from 74 boreholes spread throughout the Permian Basin of west Texas and southeast New Mexico (fig. 1). The resulting data consist of 3 to 24 individual R_o analyses representing progressively deeper stratigraphic units in each of the boreholes (table 1). The samples, Cambrian-Ordovician to Cretaceous in age, were collected at depths ranging from 200 ft to more than 22,100 ft.

The R_o data were plotted on maps that depict three different maturation levels for organic matter in the sedimentary rocks of the Permian Basin (figs. 2-4). These maps show depths at the various borehole locations where the R_o values were calculated to be 0.6 (fig. 2), 1.3 (fig. 3), and 2.0 (fig. 4) percent, which correspond, generally, to the onset of oil generation, the onset of oil cracking, and the limit of oil preservation, respectively.

The four major geologic structural features within the Permian Basin–Midland Basin, Delaware Basin, Central Basin Platform, and Northwest Shelf (fig. 1) differ in overall depth, thermal history and tectonic style. In the western Delaware Basin, for example, higher maturation is observed at relatively shallow depths, resulting from uplift and eastward basin tilting that began in the Mississippian and ultimately exposed older, thermally mature rocks. Maturity was further enhanced in this basin by the emplacement of early and mid-Tertiary intrusives. Volcanic activity also appears to have been a controlling factor for maturation of organic matter in the southern part of the otherwise tectonically stable Northwest Shelf (Barker and Pawlewicz, 1987). Depths to the three different R_o values are greatest in the eastern Delaware Basin and southern Midland Basin. This appears to be a function of tectonic activity related to the Marathon-Ouachita orogeny, during the Late-Middle Pennsylvanian, whose affects were widespread across

the Permian Basin. The Central Basin Platform has been a positive feature since the mid-to-late Paleozoic, during which time sedimentation occurred along its flanks. This non-subsidence, along with the lack of supplemental heating (volcanism), implies lower maturation levels.

Barker, C.E., and Pawlewicz, M.J., 1987, The effects of igneous intrusions and higher heat flow on the thermal maturity of Leonardian and younger rocks, western Delaware basin, Texas, *in* Cromwell, D.W. ed., Glass Mountains Guidebook, Permian Basin Section, Society of Economic Paleontologists and Mineralogists, p. 69-83.

Table 1: List of boreholes in the Permian Basin, west Texas and southeast New Mexico, from which drill cuttings were collected for vitrinite reflectance analysis. Eighty-four boreholes are listed, and locations are plotted in figure 1. However, depths to the 0.6-, 1.3-, and 2.0-percent vitrinite reflectance levels were calculated for only 74 boreholes because for the other 10, shown as green dots in figure 1 and identified here with the notation “Location not listed in figures 2-4,” the stratigraphic intervals sampled were too limited for constructing meaningful regression curves to accurately determine depths.

[Map ID, borehole number (fig. 1); Lease Name, oil and gas lease name and number; Operator, borehole name; Depth (1st column), sample depth in feet; %R_o (1st column), mean vitrinite reflectance value; Longitude and Latitude, indicates center point within a quarter-mile grid cell in which borehole is located (proprietary agreement with database provider prevents the listing of precise longitude and latitude); Elev., surface elevation at borehole location; %R_o (2nd column), the three vitrinite reflectance values for which depths were calculated and plotted in figures 2-4; Depth (2nd column), calculated depths corresponding to the three vitrinite reflectance values; Depth (3rd column), below sea-level elevations of the three vitrinite reflectance levels.]

Figure 1: Map of the Permian Basin, west Texas and southeast New Mexico, showing boundaries of major structural features and locations of boreholes from which samples were collected for vitrinite reflectance analysis. Numbers refer to listing of boreholes in table 1. Yellow dots indicate boreholes for which depths to the 0.6-, 1.3-, and 2.0-percent vitrinite reflectance levels were not calculated.

Figure 2: Map showing calculated depths to the 0.6-percent vitrinite reflectance value in the Permian Basin, west Texas and southeast New Mexico.

Figure 3: Map showing calculated depths to the 1.3-percent vitrinite reflectance value in the Permian Basin, west Texas and southeast New Mexico.

Figure 4: Map showing calculated depths to the 2.0-percent vitrinite reflectance value in the Permian Basin, west Texas and southeast New Mexico.
