Executive Director
NAGB
Washington, D.C.

## What is The Nation's Report Card ${ }^{\text {" }}$ ?

The Nation's Report Card ${ }^{\text {TM }}$ informs the public about the academic achievement of elementary and secondary students in the United States. Report cards communicate the findings of the National Assessment of Educational Progress (NAEP), the only continuing and nationally representative measure of achievement in various subjects over time. The Nation's Report Card ${ }^{\mathrm{TM}}$ compares performance among states, urban districts, public and private schools, and student demographic groups.
For over three decades, NAEP assessments have been conducted periodically in reading, mathematics, science, writing, history, geography, and other subjects. By making objective information available on student performance at the national, state, and local levels, NAEP is an integral part of our nation's evaluation of the condition and progress of education. Only information related to academic achievement and relevant variables is collected. The privacy of individual students is protected, and the identities of participating schools are not released.

NAEP is a congressionally mandated project of the National Center for Education Statistics within the Institute of Education Sciences of the U.S. Department of Education. By law, the Commissioner of Education Statistics is responsible for carrying out the NAEP project. The National Assessment Governing Board (NAGB) oversees and sets policy for NAEP. NAGB is an independent, bipartisan group composed of 26 representatives from throughout the U.S., including state and local officials, educators, business leaders, and members of the general public.

## For More Information...

The NAEP initial release website (www.nationsreportcard.gov) provides:

- Interactive displays of trial urban district results
- NAEP Data Explorer for statistical testing
- Snapshot reports for individual urban districts
- NAEP released questions tool

## Executive Summary

NAEP is a sample-based survey assessment that provides periodic reports on student academic performance at the national and state levels. The Trial Urban District Assessment (TUDA), a special project in NAEP, began assessing performance in selected large urban districts in 2002 with reading and writing assessments, and continued in 2003 and 2005 with reading and mathematics assessments. Eleven large urban school districts participated in 2005, with Austin participating for the first time. This report provides the 2005 NAEP mathematics results for the participating districts. The report compares results to public school students' performance in the nation and in large central cities, and to results for the previous mathematics assessment in 2003, where applicable, using a .05 significance level.

## Mathematics Results for Grade 4

In 2005, public school students in Austin and Charlotte had higher average scale scores than students nationally; average scores in the other districts were lower than the national average. Compared with students in large central city public schools nationwide, students in Austin, Charlotte, Houston, New York City, and San Diego had higher average scores and higher percentages performing at or above Basic. Boston had higher percentages at or above Basic. Students in Austin, Charlotte, and San Diego had higher percentages performing at or above Proficient. Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic and at or above Proficient.

Compared to students of the same race/ethnicity in large central city schools, Black students in Austin, Boston, Charlotte, Houston, and New York City had higher average scores and higher percentages performing at or above Basic. Black students in Chicago, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic. Hispanic students in Austin, Charlotte, Houston, and New York City had higher average scores and higher percentages performing at or above Basic. Hispanic students in Chicago, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic.

Between 2003 and 2005, both the average scores and the percentages performing at or above Basic increased
in Atlanta, Boston, Cleveland, the District of Columbia, Houston, Los Angeles, New York City, and San Diego. The same districts, except for Atlanta and Cleveland, also showed increases in the percentage of students performing at or above Proficient between 2003 and 2005.

## Mathematics Results for Grade 8

In 2005, average scores for students in Austin and Charlotte were higher than the average score for public school students in the nation, with average scores in the other districts lower. Compared with students in large central cities, students in Austin, Boston, Charlotte, and San Diego had higher average scores and higher percentages performing at or above Basic. Austin, Boston, and Charlotte also had higher percentages of students performing at or above Proficient. Houston had a higher percentage at or above Basic, but a lower percentage at or above Proficient. Students in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic and at or above Proficient.

Compared to students of the same race/ethnicity in large central city schools, Black students in Austin, Boston, Charlotte, Houston, and New York City had higher average scores and higher percentages at or above Basic. Black students in Atlanta, Chicago, Cleveland, and the District of Columbia had lower average scores and lower percentages performing at or above Basic. Black students in Los Angeles had lower average scores. Hispanic students in Austin, Chicago, and Houston had higher average scores and higher percentages performing at or above Basic than their large central city peers. Hispanic students in Los Angeles had lower average scores and lower percentages performing at or above Basic.

Between 2003 and 2005, the average scores and the percentages of students performing at or above Basic and at or above Proficient increased in Boston, Houston, Los Angeles, and San Diego.

## Introduction and Overall Performance: Grades 4 and 8

In 2005 , ten urban school districts participated in the TUDA in mathematics at grades 4 and 8 . The participating cities were Atlanta, Austin, Boston, Charlotte, Chicago, Cleveland, Houston, Los Angeles, New York City, and San Diego. (See the Technical Notes section for the full names of the school districts.) Austin participated for the first time in 2005. Results for District of Columbia public school students, normally included along with NAEP's state assessment results, are also reported. The results for these districts are for public school students only.
In this report, NAEP results are presented in two ways: as average scale scores and as the percentage of students performing at or above three standards called achievement levels. NAEP mathematics scores are reported for grades 4 and 8 on a $0-500$ scale. Separate scales are created for other subjects, so even when a subject's scale has the same numerical range ( $0-500$ ), average scores should not be compared across subjects.
Achievement levels are performance standards set by NAGB in a national process based on recommendations from panels of educators and members of the public. These performance standards indicate what students should know and be able to do in school subjects. The standards define basic, proficient, and advanced performance, providing a context for interpreting student results.

Urban district results are compared with results for public school students in the
nation and in large central cities (population of 250,000 or more). As shown in figure 1 , average scores for large central cities are lower than average scores for the nation. In many cases, students in participating urban districts also scored lower, on average, than those in the nation. In 2005, grade 4 students in Austin and Charlotte had higher average scores than those in the nation, and all other districts had lower average scores. At grade 8, students in Austin and Charlotte also had higher average scores than students in the nation. The average scores in all other districts were lower than the nation's average score.
The focus of the "Key Findings" boxes throughout the report is on comparing students in urban districts and large central city schools, because these schools represent a peer group, and are a more appropriate comparison than the nation as a whole for these urban districts.

Overall performance results for districts can be seen in figure 1; apparent differences between districts may not be statistically significant (at the .05 level). Note that the differences marked can indicate either higher or lower scores or percentages for the district. Figures A-1 to A- 4 in the appendix display the statistically significant differences in performance among the districts. The rates of exclusion of students with disabilities and English language learners vary across districts and could affect comparisons of district performance. These rates are displayed in tables A-2 and A-3 in the appendix.

## NAEP Achievement Levels

The three NAEP achievement levels, from lowest to highest, are Basic-denotes partial mastery of the knowledge and skills that are fundamental for proficient work at a given grade.
Proficient-represents solid academic performance. Students reaching this level have demonstrated competency over challenging subject matter.
Advanced-signifies superior performance.
See pages 16 and 20 for brief descriptions of the achievement levels for mathematics. Detailed descriptions of the NAEP achievement levels for each subject can be found on the NAGB website (http://www.nagb.org/pubs/pubs.html).

## KEY FINDINGS

GRADE 4

- Compared with student performance in large central city schools...
students in Austin, Charlotte, Houston, New York City, and San Diego had higher average scores and higher percentages performing at or above Basic.
Austin, Charlotte, and San Diego had higher percentages performing at or above Proficient.
Boston had a higher percentage of students performing at or above Basic.
students in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic and at or above Proficient.

GRADE 8

- Compared with student performance in large central city schools...
students in Austin, Boston, Charlotte, and San Diego had higher average scores and higher percentages performing at or above Basic.
Austin, Boston, and Charlotte had higher percentages performing at or above Proficient.
Houston had a higher percentage of students performing at or above Basic, but a lower percentage at or above Proficient.
students in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic and at or above Proficient.

Figure 1. Average mathematics scale scores and percentage of students within each achievement level, grades 4 and 8 public schools: By urban district, 2005

\# The estimate rounds to zero.

* Average score significantly different from large central city public schools.
** Average score significantly different from nation (public schools).
NOTE: Detail may not sum to totals because of rounding. The shaded bars are graphed using unrounded numbers.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Trial Urban District Mathematics Assessment.

## A Note on Achievement Levels

As provided by law, the National Center for Education Statistics (NCES), upon review of congressionally mandated evaluations of NAEP, has determined that achievement levels are to be used on a trial basis and should be interpreted with caution. However, NCES and NAGB have affirmed the usefulness of these performance standards for understanding trends in achievement. NAEP achievement levels have been widely used by national and state officials. Information about what students at each grade level should know and be able to do at each achievement level is provided in the "Framework and Sample Questions" section.

## Student Group Results

## District Mathematics Results by Race/Ethnicity: Grade 4

NAEP obtains information on a student's race/ethnicity from school rosters and reports it as one of six categories: White, Black, Hispanic, Asian/Pacific Islander, American Indian/Alaska Native, and Unclassified. Black includes African American, Hispanic includes Latino, and Pacific Islander includes Native Hawaiian. Race categories exclude Hispanic origin unless specified. If the school roster was left blank for a student, student-reported race/ethnicity was used.

Table 1 shows the percentages of students in grade 4 in each of the participating districts for 2005 by race/ethnicity. In each of the urban districts assessed, Black students and/or Hispanic students constituted the majority in grade 4. For the 2005 national assessment in public schools, White students constituted a majority- 57 percent of the grade 4 sample.

Table 2 shows the average scale scores and the percentages of students performing below Basic, at or above Basic, and at or above Proficient in 2005 for White, Black, Hispanic, and Asian/Pacific Islander students in grade 4. Performance results are not presented for American Indian/Alaska Native and Unclassified categories because of small sample sizes. Districts are rank-ordered by average scale score within each racial/ethnic category. Asterisks in the table mark statistically significant differences between results for students in the urban districts and their counterparts in the nation and in large central cities. Information on average score gaps between White and Black students and between White and Hispanic students for each district, for 2005 and previous assessments, can be found in figure A-5 in the appendix. For more information on results by race/ethnicity, visit http://nces.ed.gov/nationsreportcard/ naepdata.

## KEY FINDINGS

GRADE 4
Compared to students of the same race/ethnicity in large central city schools...

Black students in Austin, Boston, Charlotte, Houston, and New York City had higher average scores and higher percentages performing at or above Basic.

Black students in Chicago, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic.
Hispanic students in Austin, Charlotte, Houston, and New York City had higher average scores and higher percentages performing at or above Basic.
Hispanic students in Chicago, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic.

Asian/Pacific Islander students in Boston, Charlotte, and New York City had higher average scores.
Asian/Pacific Islander students in Boston and New York City had higher percentages performing at or above Basic.

## District Mathematics Results by Race/Ethnicity: Grade 8

Table 3, similar to table 1 , shows the percentages of students in grade 8 by race/ethnicity for each of the participating districts. In each of the urban districts assessed, Black students and/or Hispanic students constituted the majority in grade 8. For the 2005 national assessment in public schools, White students constituted a majority - 60 percent of the grade 8 sample. Table 4 displays the average scores and percentages performing below Basic, at or above Basic, and at or above

Proficient in 2005 for the same racial/ethnic groups as in table 2. The districts are rank-ordered by average scale score within each racial/ethnic category.

Information on average score gaps between White and Black students and between White and Hispanic students for each district, for 2005 and previous assessments, can be found in figure A-6 in the appendix.

Table 3. Percentage of students by race/ethnicity in mathematics, grade 8 public schools: By urban district, 2005

|  |  |  |  | American <br> Indian/Alaska |  |  |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| District | White | Black | Hispanic | Asian/Pacific <br> Islander | Native | Unclassified $^{1}$ |

## KEY FINDINGS

GRADE 8
Compared to students of the same race/ethnicity in large central city schools...

Black students in Austin, Boston, Charlotte, Houston, and New York City had higher average scores and higher percentages performing at or above Basic.

Black students in Atlanta, Chicago, Cleveland, and the District of Columbia had lower average scores and lower percentages performing at or above Basic.

Black students in Los Angeles had lower average scores.
Hispanic students in Austin, Chicago, and Houston had higher average scores and higher percentages performing at or above Basic.

Hispanic students in Los Angeles had a lower average score and a lower percentage performing at or above Basic.
Asian/Pacific Islander students in Boston had a higher average score and a higher percentage performing at or above Basic.

## District Mathematics Results by Eligibility for Free/Reduced-Price School Lunch: Grade 4

An indicator of a student's socioeconomic status is whether or not that student is eligible for free or reduced-price lunch under the National School Lunch Program (NSLP). Children from families with incomes at or below 130 percent of the poverty level are eligible for free meals
under the NSLP. Those with incomes between 130 percent and 185 percent of the poverty level are eligible for reducedprice meals. (For the period July 1, 2004, through June 30, 2005, for a family of four 130 percent of the poverty level was $\$ 24,505$, and 185 percent was $\$ 34,873$.)

## KEY FINDINGS

GRADE 4
Compared to students eligible for free/reducedprice lunch in large central city schools...
eligible students in Austin, Boston, Charlotte, Houston, New York City, and San Diego had higher average scores and higher percentages performing at or above Basic.
eligible students in Atlanta, Chicago, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic.

GRADE 8
Compared to students eligible for free/reducedprice lunch in large central city schools...
eligible students in Austin, Boston, Charlotte, Houston, and New York City had higher average scores.
eligible students in Austin, Boston, Charlotte, Houston, New York City, and San Diego had higher percentages performing at or above Basic. eligible students in Atlanta, Cleveland, the District of Columbia, and Los Angeles had lower average scores and lower percentages performing at or above Basic.

Average mathematics scale scores and achievementlevel results by students' eligibility for free/reduced-price school lunch are shown in table 5 for grade 4 and in table 6 for grade 8 . Districts are rank-ordered by average scale score within the "eligible" and "not eligible" categories.

For comparison purposes, data are also provided for the nation and for large central cities. At grades 4 and 8, all districts except Austin, Charlotte, and San Diego had higher percentages of eligible students than did large central cities.

## District Mathematics Results by Gender: Grades 4 and 8

The percentages of male and female students, their average scale scores, and the percentages performing below Basic, at or above Basic, and at or above Proficient are presented by district in table 7 for grade 4
and in table 8 for grade 8 . At both grades 4 and 8 , there were no significant differences between the average scores of male and female students within any of the districts in 2005.

Table 7. Average scale scores and achievement-level results in mathematics, by gender, grade 4 public schools: By urban district, 2005

| District | Percentage of all students | Average scale score | Percentage of students |  |  |

## KEY FINDINGS

## GRADE 4

- Compared to students of the same gender in large central city schools...
male students in Austin, Charlotte, Houston, New York City, and San Diego had higher average scores and higher percentages performing at or above Basic; male students in all other districts, except for Boston, performed lower on both measures.
female students in Austin, Boston, Charlotte, Houston, New York City, and San Diego had higher average scores; female students in all other districts scored lower.

## GRADE 8

Compared to students of the same gender in large central city schools...
male students in Austin and Charlotte had higher average scores and higher percentages performing at or above Basic; male students in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles performed lower on both measures.
female students in Austin, Boston, Charlotte, and San Diego had higher average scores and higher percentages performing at or above Basic; female students in Atlanta, Chicago, Cleveland, the District of Columbia, and Los Angeles performed lower on both measures.

Table 8. Average scale scores and achievement-level results in mathematics, by gender, grade 8 public schools: By urban district, 2005

|  |  |  |  |

[^2]
## Changes in Performance

Of the 11 urban districts with assessment results for 2005 , ten have comparison data from the 2003 assessment (Austin first participated in 2005). The vertical bars in figure 2 represent the average scale scores for grade 4 in 2003 and 2005 for public schools in the nation, in large central cities, and in each of the participating districts. An asterisk below the score in 2003 indicates that it is statistically different from the corresponding average score in 2005.

Table 9 presents the achievement-level results for each of the assessment years by district for grade 4 . Percentages for 2003 that are statistically different from the corresponding percentage in 2005 are marked with an asterisk (*).
On page 14, figure 3 shows the average scale scores across years by district for grade 8 . Table 10 displays the achieve-ment-level results by district for 2003 and 2005 for grade 8 .

## KEY FINDINGS

## GRADE 4

Between 2003 and 2005, average scores increased in 8 of the 10 urban districts that participated in both years: Atlanta, Boston, Cleveland, the District of Columbia, Houston, Los Angeles, New York City, and San Diego.

- The same 8 districts showed increases in the percentages of students performing at or above Basic.

Boston, the District of Columbia, Houston, Los Angeles, New York City, and San Diego showed increases in the percentages of students performing at or above Proficient.

GRADE 8 (page 14)
Between 2003 and 2005, average scores increased in 4 of the 10 urban districts that participated in both years: Boston, Houston, Los Angeles, and San Diego.

The same 4 districts showed increases in the percentages of students performing at or above Basic and at or above Proficient.

## For More Information...

More information on average scores and achievement-level results for a particular district or student group is available at http://nces.ed.gov/nationsreportcard/naepdata. This interactive site provides a data tool for exploring results and calculating the statistical significance of differences.

Figure 2. Average mathematics scale scores, grade 4 public schools: By urban district, 2003 and 2005

* Significantly different from 2005.
${ }^{1}$ Some of the TUDA districts include a few public schools located outside of large central cities as defined by the Census Bureau (population of 250,000 or more within metropolitan areas). These schools were included in the category of "large central city" in the present report for all years, but were not included in results published in previous reports. As a result, some numbers reported in this report may differ slightly from those reported in earlier ones.
${ }^{2}$ The district did not participate in 2003.

## Framework and Sample Questions: Grade 4

The content of the NAEP mathematics assessment is based on a framework, that describes in detail how mathematics should be assessed by NAEP. The current NAEP mathematics framework was first used for the 1990 assessment and has continued to be the basis for the assessment content. It was developed through a comprehensive national consultative process and adopted by NAGB. The framework calls for the assessment of mathematics within five content areas and at different levels of complexity.
Mathematics content areas. In order to ensure that NAEP assesses an appropriate balance of content, the framework defines five broad areas of mathematical content. The content areas assessed at grade 4 are number properties and operations, measurement, geometry, data analysis and probability, and algebra. The framework calls for the test questions at grade 4 to be distributed across the five content areas in the following proportions:

| Number properties <br> and operations | Measurement | Geometry |
| :---: | :---: | :---: |
| $40 \%$ | $20 \%$ | $15 \%$ |

| Data analysis and <br> probability | Algebra |
| :---: | :---: |
| $10 \%$ | $15 \%$ |

Mathematical complexity. The framework also calls for an assessment that measures different levels of mathematical complexity to make sure that NAEP assesses a variety of ways of knowing and doing mathematics. The level of complexity of a test question is determined by the demands that it places on students. For example, test questions with a high level of complexity at grade 4 might ask students to solve a problem in more than one way. According to the framework, the ideal balance for the assessment is that half the score is based on items of moderate complexity, with the remainder of the score based equally on items of low and high complexity.

Revisions were made to the framework for the 1996 assessment and again for the 2005 assessment. For example, the names of some of the content areas changed in 2005, but there remains a consistent focus on the five key areas. The framework reflects current curricular emphases and objectives, while continuing a connection to previous frameworks.
The grade 4 mathematics assessment consists of ten 25minute sections of mathematics questions. Each section contains 14 to 20 questions. The questions are both multiple choice and constructed response. Multiple-choice questions require students to select an answer from four options, while constructed-response questions require students to write either short or extended answers. Each student receives only a portion of the entire assessment, consisting of a booklet containing two 25 -minute sections of mathematics questions.

## Item Maps

The item maps presented on pages 17 and 21 illustrate the knowledge and skills demonstrated by students performing at different score points on the 2005 NAEP mathematics assessment. In order to provide additional context, the cut scores for the three NAEP achievement levels are marked on the item maps. The map location for each question represents the probability that, for a given score point, 65 percent of the students for a constructed-response question, 74 percent of the students for a four-option multiple-choice question, or 72 percent of the students for a five-option multiple-choice question answered that question successfully. For constructed-response questions, only responses considered to be completely correct are shown on the item maps.

## Achievement-Level Descriptions for Grade 4

Mathematics achievement-level descriptions are based on NAGB achievement-level policy descriptions with subject- and grade-specific information added. The following descriptions are abbreviated versions of the full
achievement-level descriptions for grade 4 mathematics. The full descriptions can be found at http://www.nagb.org/ pubs/mathbook.pdf.

Basic: Fourth-grade students performing at the Basic level should be able to estimate and use basic facts to perform simple computations with whole numbers; show some understanding of fractions and decimals; and solve some simple real-world problems in all NAEP content areas. Students at this level should be able to use-though not always accurately-four-function calculators, rulers, and geometric shapes. Their written responses will often be minimal and presented without supporting information.

Proficient: Fourth-grade students performing at the Proficient level should be able to use whole numbers to estimate, compute, and determine whether results are reasonable. They should have a conceptual understanding of fractions and decimals; be able to solve real-world problems in all NAEP content areas; and use four-function calculators, rulers, and geometric shapes appropriately. Students performing at the Proficient level should employ problem-solving strategies such as identifying and using appropriate information. Their written solutions should be organized and presented both with supporting information and explanations of how they were achieved.

Advanced: Fourth-grade students performing at the Advanced level should be able to solve complex and nonroutine real-world problems in all NAEP content areas. They should display mastery in the use of four-function calculators, rulers, and geometric shapes. The students are expected to draw logical conclusions and justify answers and solution processes by explaining why, as well as how, they were achieved. They should go beyond the obvious in their interpretations and be able to communicate their thoughts clearly and concisely.

## Cut Scores

Cut scores represent the minimum score required for performance at each NAEP achievement level. NAEP cut scores were determined through a standard-setting process that convened a cross-section of educators and interested citizens from across the nation. The group was asked to determine what students should know and be able to do relative to a body of content reflected in the mathematics framework. NAGB then adopted a set of cut scores on the 0-500 scale that define the lower boundaries of the Basic, Proficient, and Advanced achievement levels. The mathematics cut scores, which appear on the item maps, are as follows:

|  | Grade 4 | Grade 8 |
| ---: | ---: | ---: |
| Basic | 214 | 262 |
| Proficient | 249 | 299 |
| Advanced | 282 | 333 |

## Grade 4 Item Map

This map describes the knowledge or skill associated with answering individual mathematics questions. The map identifies the score point at which students had a high probability of successfully answering the question. ${ }^{1}$

| 260 | 260 Determine the width of a rectangle after it is folded |
| :--- | :--- |
| 258 Represent a situation with an algebraic expression-Sample Question 1 |  |
| 254 | Identify which figure on grid has greatest area |
| 253 Complete a bar graph from a description of data |  |

245 Determine the value of a point on a number line-Sample Question 2
240

## 190

${ }^{1}$ Each grade 4 mathematics question in the 2005 mathematics assessment was mapped onto the NAEP 0-500 mathematics scale. The position of a question on the scale represents the average scale score attained by students who had a 65 percent probability of successfully answering a constructed-response question, or a 74 percent probability of correctly answering a four-option multiplechoice question. Only selected questions are presented. Scale score ranges for mathematics achievement levels are referenced on the map. For constructed-response questions, the question description represents students' performance rated as completely correct.
NOTE: Regular type denotes a constructed-response question. Italic type denotes a multiple-choice question.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Mathematics Assessment.

## Sample Grade 4 Multiple-Choice Question

Sample Question 1 is a multiple-choice question in the algebra content area. This question asked students to represent a given situation with an algebraic expression.

1. $N$ stands for the number of hours of sleep Ken gets each night. Which of the following represents the number of hours of sleep Ken gets in 1 week?
(A) $N+7$
(B) $N-7$

- $N \times 7$
(1) $N \div 7$

61 percent of fourth-graders answered this question correctly.

## Sample Grade 4 Short Constructed-Response Question

Sample Question 2 is a short constructed-response question in the number properties and operations content area. This question asked students to identify the point indicated on a number line. The response shown here would have been rated correct.

2. On the number line above, what number would be located at point $P$ ?

Answer: $\qquad$

## Framework and Sample Questions: Grade 8

As at grade 4, the content of the mathematics assessment at grade 8 is based on a framework that describes in detail how mathematics should be assessed by NAEP. The current NAEP mathematics framework was first used for the 1990 assessment and has continued to be the basis for the assessment content. It was developed through a comprehensive national consultative process and adopted by NAGB. The framework calls for the assessment of mathematics within five content areas and at different levels of complexity.
Mathematics content areas. In order to ensure that NAEP assesses an appropriate balance of content, the framework defines five broad areas of mathematical content. The content areas assessed at grade 8 are the same as those assessed at grade 4: number properties and operations, measurement, geometry, data analysis and probability, and algebra. At grade 8, however, the emphasis placed on each content area is different from that at grade 4, to reflect differences in curricular emphasis at the two grades. The framework calls for the eighth-grade test questions to be distributed across the five content areas in the following proportions:

| Number properties <br> and operations | Measurement | Geometry |
| :---: | :---: | :---: |
| $20 \%$ | $15 \%$ | $20 \%$ |

| Data analysis and <br> probability | Algebra |
| :---: | :---: |
| $15 \%$ | $30 \%$ |

Mathematical complexity. As at grade 4, the framework calls for an assessment at grade 8 that measures different levels of mathematical complexity, to make sure that NAEP assesses a variety of ways of knowing and doing mathematics. The level of complexity of a test question is determined by the demands that it places on students. For example, test questions at grade 8 with a high level of complexity might ask students to provide a mathematical justification. According to the framework, the ideal balance for the assessment is that half the score is based on items of moderate complexity, with the remainder of the score based equally on items of low and high complexity.

Revisions were made to the framework for the 1996 assessment and again for the 2005 assessment. For example, the names of some of the content areas changed in 2005, but there remains a consistent focus on the five key areas. The framework reflects current curricular emphases and objectives, while continuing a connection to previous frameworks.

The grade 8 mathematics assessment consists of ten 25 -minute sections of mathematics questions. Each section contains 16 to 21 questions. The questions are either multiple choice or constructed response. Multiple-choice questions require students to select an answer from four or five options, while constructed-response questions require students to write either short or extended answers. Each student receives only a portion of the entire assessment, consisting of a booklet containing two 25 -minute sections of mathematics questions.

## For More Information...

The complete mathematics framework is available on the NAGB website (http://www.nagb.org/pubs/pubs.html). To view more questions, including sample responses and statistics, visit the NAEP questions tool at http://nces.ed.gov/nationsreportcard/itmrls/.

## Achievement-Level Descriptions for Grade 8

Mathematics achievement-level descriptions are based on NAGB achievement-level policy descriptions with sub-ject- and grade-specific information added. The following descriptions are abbreviated versions of the full achieve-
ment-level descriptions for grade 8 mathematics. The full descriptions can be found at http://www.nagb.org/pubs/ mathbook.pdf.

Basic: Eighth-grade students performing at the Basic level should complete problems correctly with the help of structural prompts such as diagrams, charts, and graphs. They should be able to solve problems in all NAEP content areas through the appropriate selection and use of strategies and technological tools-including calculators, computers, and geometric shapes. Students at this level also should be able to use fundamental algebraic and informal geometric concepts in problem solving.

Proficient: Eighth-grade students performing at the Proficient level should be able to conjecture, defend their ideas, and give supporting examples. They should understand the connections between fractions, percents, decimals, and other mathematical topics such as algebra and functions. Students at this level are expected to have a thorough understanding of Basic-level arithmetic operations-an understanding sufficient for problem solving in practical situations.

Advanced: Eighth-grade students performing at the Advanced level should be able to probe examples and counterexamples in order to shape generalizations from which they can develop models. Eighth-graders performing at the Advanced level should use number sense and geometric awareness to consider the reasonableness of an answer. They are expected to use abstract thinking to create unique problem-solving techniques and explain the reasoning processes underlying their conclusions.

## Grade 8 Item Map

This map describes the knowledge or skill associated with answering individual mathematics questions. The map identifies the score point at which students had a high probability of successfully answering the question. ${ }^{1}$

## Sample Grade 8 Multiple-Choice Question

Sample Question 3 is a multiple-choice question in the algebra content area. This question asked students to infer a rule and find the next term in a sequence. The terms in this sequence are the squares of consecutive odd numbers.

$$
1,9,25,49,81, \ldots
$$

3. The same rule is applied to each number in the pattern above. What is the 6th number in the pattern?
(A) 40
(B) 100

- 121
(D) 144
(E) 169

## 60 percent of eighth-graders answered this question correctly.

## Sample Grade 8 Short Constructed-Response Question

Sample Question 4 is a short constructed-response question in the geometry content area. This question asked students to shade five additional squares in a grid that has three shaded squares to create a symmetric pattern. Students were given paper squares for this question. The response shown here would have been rated correct.
4. Shade five more squares on the grid below so that if your completed figure were folded along the fold line both sides would match.

## Technical Notes and Data Appendix

## About This Revised Report

The initial version of this TUDA report was released on December 1, 2005. In the national report card for mathematics for 2005, the "type of location" variable was not reported with across year trends because the US Census classifications of too many schools had changed. Consequently, the "large central city" variable, one of the categories in "type of location," was not reported for 2003 in the initial TUDA mathematics report. However, subsequent analyses showed that while the overall "type of location" variable was not sufficiently consistent to report student performance trends, the "large central city" school classifications had remained stable enough across 2003 and 2005 to permit reporting of trend results within this category. The main difference between this revised report and the original is the addition of large central city performance data in 2003.

## Participating Districts

In 2005, ten urban public school districts participated in the TUDA in mathematics at grades 4 and 8. The school district names, as used in the NCES Common Core of Data, are Atlanta City School District, Austin Independent School District, Boston School District, Charlotte-Mecklenburg Schools, City of Chicago School District 299, Cleveland Municipal School District, Houston Independent School District, Los Angeles Unified School District, New York City Public Schools, and San Diego Unified School District. Results for the District of Columbia public school students, normally included along with NAEP's state assessment results, are also reported. The results for these districts are for public school students only.

## NAEP Sampling Procedures

The sample of students in the participating TUDA school districts represents an augmentation of the sample of students who would usually be selected by NAEP as part of state samples. These augmented samples allow reliable reporting of student groups within these districts. Students in the TUDA samples are also included in "higher-level" samples. For example, data from students tested in the Los Angeles sample were used to report results for Los Angeles, and also contributed to the California and the national samples.

In the same way that schools and students participating in national NAEP assessments are chosen to be nationally representative, samples of schools and students in the urban districts were selected to be representative of their districts. The results from the assessed students are combined to provide accurate estimates of overall district performance. Results are weighted to take into account the fact that schools within districts represent different proportions of the overall district population. Table A-1 displays the sample sizes and target populations for the districts for 2003 and 2005.

## Accommodations

It is important to assess all selected students from the target population, including students with disabilities (SD) and students classified by their schools as English language learners (ELL). To accomplish this goal, students who receive accommodations in their state's assessments, such as extra testing time or individual rather than group administration, are offered most of the same accommodations in NAEP. One notable exception is that students may not use calculators in NAEP in the sections where questions are not intended for calculator use.

## Exclusion Rates

Some students identified as SD or ELL who are sampled for NAEP participation may be excluded from the assessment according to carefully defined criteria. School personnel, guided by the student's Individualized Education Program (IEP), as well as by section 504 eligibility, make decisions regarding inclusion in the assessment of students with disabilities. Based on NAEP's guidelines, they also make the decision whether to exclude students identified as ELL. The process includes evaluating the student's capability to participate in the assessment in English, as well as taking into consideration the number of years the student has been receiving instruction in English. The percentages of students excluded from NAEP may vary considerably across states and districts, as well as across years. Comparisons of achievement results across districts and within a district across years should be interpreted with caution if the exclusion rates vary widely. (See tables A-2 and A-3 for exclusion rates in 2003 and 2005.)

## School and Student Participation Rates

In order to ensure reportable samples, NCES and NAGB established participation rate standards that states and jurisdictions are required to meet in order for their results to be reported. The same standards were applied to the urban districts. Participation rates before substitution needed to be at least 80 percent for schools and at least 85 percent for students in each subject and grade. Results are not reported in any instances in which participation rates did not meet the established standards for certain student groups or jurisdictions. In the 2005 mathematics assessment, all states, jurisdictions, and participating urban districts met NAEP participation rate standards at both grades 4 and 8 (see table A-1).

## Interpreting Statistical Significance

Comparisons over time or between groups in this report are based on statistical tests that consider both the size of the differences and the standard errors of the two statistics being compared. Standard errors are measures of the margin of error in samples. Estimates based on smaller samples are likely to have larger margins of error than estimates based on large samples. The size of the standard errors may also be influenced by other factors, such as how representative the assessed students are of the population as a whole. When an estimate, such as an average score, has a large standard error, a numerical
difference that seems large may not be statistically significant. Differences of the same magnitude may or may not be statistically significant, depending upon the size of the standard errors of the statistics. For example, a 3-point difference between male and female students may be statistically significant, while a 3-point difference between White and Asian/Pacific Islander students may not be. Standard errors for the NAEP scores and percentages presented in this report are available on the NAEP website (http://nces.ed.gov/nationsreportcard/naepdata/).

In the tables and charts of this report, asterisks are used to indicate that a score or percentage in 2005 is significantly different from the comparable measure in a previous assessment year, or to indicate differences from national or large central city results. Any difference between scores or percentages that is identified in the text as higher, lower, larger, or smaller in this report, including within-group differences not marked in tables and charts, meets the requirements for statistical significance. The differences described in this report have been determined to be statistically significant at the .05 level with appropriate adjustments for multiple comparisons.
"Large central city" in this report includes public schools located in large central cities (with populations of 250,000 or more) throughout the United States within metropolitan statistical areas as defined by the federal

Table A-1. School and student participation rates and target populations, grades 4 and 8 public schools: By urban district, 2005

| District | School participation |  | Student participation |  | Target population |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Student-weighted percent before substitution | Number of schools participating | Student-weighted percent | Number of students assessed |  |

| San Diego | 100 | < 50 | 89 | 1,300 | 10,000 |

NOTE: The numbers of schools and students are rounded to the nearest hundred, or indicated as < 50 where the value was between 1 and 49. The target population is rounded to the nearest thousand.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Trial Urban District Mathematics Assessment.

Office of Management and Budget. The term is not synonymous with "inner city." Urban districts are school districts that include schools in their large central cities. Some districts (Austin, Charlotte, Cleveland, Houston, and Los Angeles) encompass a small percentage of schools not classified as large central city. In these cases, the data from the entire district were used in statistical comparisons to large central city schools. Further comparisons of urban
district student group data with large central city data are available from the online data explorer on the NAEP website (http://nces.ed.gov/nationsreportcard/naepdata). Selecting the variable "Large central city for urban district comparisons" when making statistical comparisons for urban districts will allow comparisons to large central city data and will permit the software user to replicate results in this report and to explore additional comparisons.

- Not available. The district did not participate in 2003.
\# The estimate rounds to zero.
${ }^{1}$ Some of the TUDA districts include a few public schools located outside of large central cities as defined by the Census Bureau (population of 250,000 or more within metropolitan areas). These schools were included in the category of "large central city" in the present report for all years, but were not included in results published in previous reports. As a result, some numbers reported in this report may differ slightly from those reported in earlier ones.
NOTE: SD = students with disabilities. ELL = English language learners. Students identified as both SD and ELL were counted only once under the combined SD and/or ELL category, but were counted separately under the SD and ELL categories.

## Cross-District Comparisons by Average Scale Score and Percentage at or Above Basic: Grades 4 and 8

Figures A-1 though A-4 compare average scores and percentages of students performing at or above Basic in each district to those in the nation, in public schools in large central cities, and in each other district. Read across the row corresponding to a district listed to the left of any of the charts. Match the shading intensity to the chart's key to determine whether the average score (or percentage
at or above Basic) of this district was found to be higher than, not significantly different from, or lower than that of the district in the column heading. In addition, the direction of the arrowheads in the comparison cells indicates whether the district in the row is significantly higher than (up arrow), lower than (down arrow), or not different from (blank cell) the district in the column heading.

Figure A-1. Cross-district comparisons of average mathematics scale scores, grade 4 public schools: 2005

District had higher average scale score than the district listed at the top of the column.

No statistically significant difference detected from the district listed at the top of the column.

District had lower average scale score than the district listed at the top of the column.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Trial Urban District Mathematics Assessment.

Figure A-2. Cross-district comparisons of percentage of students at or above Basic in mathematics, grade 4 public schools: 2005

District had higher percentage than the district listed at the top of the column.

No statistically significant difference detected from the district listed at the top of the column.

District had lower percentage than the district listed at the top of the column.

[^6]

Figure A-3. Cross-district comparisons of average mathematics scale scores, grade 8 public schools: 2005

District had higher average scale score than the district listed at the top of the column.

No statistically significant difference detected from the district listed at the top of the column.

District had lower average scale score than the district listed at the top of the column.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2005 Trial Urban District Mathematics Assessment.

Figure A-4. Cross-district comparisons of percentage of students at or above Basic in mathematics, grade 8 public schools: 2005

District had higher percentage than the district listed at the top of the column.

No statistically significant difference detected from the district listed at the top of the column.

District had lower percentage than the district listed at the top of the column.

* Significantly different from large central city public schools in 2005.
** Significantly different from nation (public schools) in 2005.
*** Significantly different from 2005.
${ }^{1}$ Some of the TUDA districts include a few public schools located outside of large central cities as defined by the Census Bureau (population of 250,000 or more within metropolitan areas). These schools were included in the category of "large central city" in the present report for all years, but were not included in results published in previous reports. As a result, some numbers reported in this report may differ slightly from those reported in earlier ones.
NOTE: Detail may not sum to totals because of rounding. Results are not shown for students whose race/ethnicity was "American Indian/Alaska Native" or "unclassified."

\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met.

* Significantly different from large central city public schools.
** Significantly different from nation (public schools).
NOTE: ELL = English language learners. Formerly ELL= students who passed their state's English-language proficiency examination within the past two years. The results for English language learners are based on students who were assessed and cannot be generalized to the total population of such students. Detail may not sum to totals because of rounding.

[^0]:    \# The estimate rounds to zero.
    1 "Unclassified" students are those whose school-reported race/ethnicity was "other" or "unavailable," or was missing, and whose race/ethnicity category could not be determined from self-reported information. NOTE: Detail may not sum to totals because of rounding.

[^3]:    - Not available. The district did not participate in 2003.
    \# The estimate rounds to zero.
    * Significantly different from 2005.
    ${ }^{1}$ Some of the TUDA districts include a few public schools located outside of large central cities as defined by the Census Bureau (population of 250,000 or more within metropolitan areas). These schools were included in the category of "large central city" in the present report for all years, but were not included in results published in previous reports. As a result, some numbers reported in this report may differ slightly from those reported in earlier ones.
    NOTE: Detail may not sum to totals because of rounding.

[^4]:    ${ }^{1}$ Each grade 8 mathematics question in the 2005 mathematics assessment was mapped onto the NAEP 0-500 mathematics scale. The position of a question on the scale represents the average scale score attained by students who had a 65 percent probability of successfully answering a constructed-response question, a 74 percent probability of correctly answering a four-option multiple-choice question, or a 72 percent probability of correctly answering a five-option multiple-choice question. Only selected questions are presented. Scale score ranges for mathematics achievement levels are referenced on the map. For constructed-response questions, the question description represents students' performance rated as completely correct.
    NOTE: Regular type denotes a constructed-response question. Italic type denotes a multiple-choice question.
