4. K-Ar dates on drill core samples 20

ABSTRACT

Chemical analyses and K-Ar ages are presented for rocks sampled from drill holes at Medicine Lake volcano, northern California. A location map and a cross-section are included, as are separate tables for drill hole information, major and trace element data, and for K-Ar dates.

INTRODUCTION

This report presents chemical analyses and K-Ar ages obtained from drill hole samples studied in support of geologic mapping at Medicine Lake volcano (MLV), northern California. The holes were drilled by private companies exploring for geothermal energy at the volcano. Drill core and cuttings were later made available for study; core is stored at the Energy and Geoscience Institute (EGI) warehouse in Salt Lake City, Utah.

Drill hole locations are shown in Figure 1 and a generalized cross-section is presented in Figure 2. Discussion of the significance of the chemical and age data will be presented elsewhere, although it is apparent from the cross-section and from Table 1 that a large percentage of MLV core consists of rocks with more than 63 percent SiO₂. A brief preliminary comparison of drill hole information and surface geologic mapping is found in Donnelly-Nolan (1990).

The classic reference for the geology of MLV is Anderson (1941). More recent general studies include Donnelly-Nolan (1988) and Donnelly-Nolan and others (1990).

METHODS

Rock samples were collected from drill core for 12 of the 13 drill holes studied by the author. For one hole, 17A6, only drill cuttings were available. Rocks were broken up using a hammer, then chipped into small fragments in a small ceramic jaw crusher. Samples were powdered in an alumina shatterbox.

Major elements (Table 2) were analyzed by X-Ray fluorescence (XRF) at the USGS chemical analysis laboratory in Denver, Colorado, by J. Taggart, A.J. Bartel, D.F. Siems, and J.S. Mee. In the original major element analyses, all iron was reported as Fe₂O₃ (FeTO₃). The normalized analyses presented in Table 2 were calculated by first recalculating all iron as FeO (=FeO*), summing all major elements without LOI (Loss on Ignition), and then recalculating all major elements to a 100 percent total.

Trace elements presented in Table 2 were analyzed by energy-dispersive XRF (Kevex) at the chemical analysis laboratory in Menlo Park, California, by P. Bruggman. Flame photometry analyses of Na₂O and K₂O in a subset of the samples is presented in Table 3; these analyses were performed by L. Espos, M. Dyslin, and T. Fries in Menlo Park, California. Also presented in Table 3 are Instrumental Neutron Activation trace element analyses (INAA) that were performed at the USGS chemical analysis laboratory in Reston, Virginia. Analysts for these data were G. Wandless, P. Baedecker, J.S. Mee, and C. Palmer.

K-Ar ages presented in Table 4 summarize data published in Donnelly-Nolan and Lanphere (2005), where complete analytical data are found.

Core boxes of drill hole 87-24 were mistakenly labeled 84-27 and are stored as such at the EGI warehouse; sample numbers for core samples from this hole are corrected here.

ACKNOWLEDGMENTS

Funding for this work was provided by the USGS Geothermal and Volcano Hazards Programs. We are grateful to the geothermal energy companies exploring at Medicine Lake volcano for making the samples available. Drill core samples were split from stored core at the Energy and Geoscience Institute in Salt Lake City, Utah. I am grateful to EGI staff for access to the core. I especially thank all of the chemists who analyzed the samples (see text for their names) and W. Loskutoff for help with sample collection and preparation.

Table 4. K-Ar ages on drill core samples

See Figure 1 for map locations and Donnelly-Nolan and Lanphere (2005) for analytical data

Hole No.	Depth in feet	Age in ka	Correlated Unit
52-4	628	382±8	rhyolite of Grasshopper Flat
57-13	1459	324±7	not at surface
68-16	753	297±6	rhyolite east of Callahan Flow
68-16	1673	397±8	not at surface

All experiments were performed on whole-rock samples of rhyolite
